

Understanding Part-Part-Whole

Before solving missing number equations students need to:

- Understand addition and subtraction.
- Understand how to represent addition and subtraction using part-part-whole.
- Use these understandings to write addition and subtraction equations where the unknown is in the typical place to the right of the equals symbol.

Addition

$$\boxed{\text{Part Known}} + \boxed{\text{Part Known}} = \boxed{\text{Whole Unknown}} \qquad 4 + 2 = \boxed{?}$$

Subtraction

$$\boxed{\text{Whole Known}} - \boxed{\text{Part Known}} = \boxed{\text{Part Unknown}} \qquad 6 - 4 = \boxed{?}$$

Addition: Part Unknown

To solve missing number addition equations where the part is unknown students can either:

(i) Use addition.

$$\boxed{?} + 2 = 6$$

Think, "What joins with 2 to make 6?"

Think, "What joins with this part to make the whole?"

Bond blocks can be used to support the calculation and check solutions.

(ii) Rearrange the equation, using part-part-whole to make a subtraction equation where the unknown is in the answer position.

$$\boxed{?} + 2 = 6 \quad \longrightarrow \quad 6 - 2 = \boxed{?}$$

The same process applies if the missing number is in the other part.

To solve missing number addition equations where the part is unknown students can either:

(i) Use addition.

$$4 + \boxed{?} = 6$$

Think, "What joins with 4 to make 6?"

Think, "What joins with this part to make the whole?"

Bond blocks can be used to support the calculation and check solutions.

(ii) Rearranging the equation, using part-part-whole to make a subtraction equation where the unknown is in the answer position.

$$4 + \boxed{?} = 6 \quad \longrightarrow \quad 6 - 4 = \boxed{?}$$

Subtraction: Part Unknown

To solve missing number subtraction equations where the part is unknown students can either:

(i) Use addition.

$$6 - \boxed{?} = 4$$

Think, "What joins with 4 to make 6?"

Think, "What joins with this part to make the whole?"

(ii) Rearrange the equation, using part-part-whole to make a subtraction equation where the unknown is in the answer position.

$$6 - \boxed{?} = 4 \quad \longrightarrow \quad 6 - 4 = \boxed{?}$$

Subtraction: Whole Unknown

To solve missing number subtraction equations where the whole is unknown students can either:

(i) Use addition.

$$\boxed{?} - 2 = 4$$

Think, "Join the parts using addition to make the whole."

Bond Blocks can be used to support the calculation and check solutions.

(ii) Rearrange the equation, using part-part-whole, to make an addition equation where the unknown is in the answer position.

$$\boxed{?} - 2 = 4 \quad \longrightarrow \quad 4 + 2 = \boxed{?}$$
